

AI analysis → Intermediary review → Regulatory approval → KYC & A-Pass → A-Token issuance → Dynamic eligibility → Payment verification & minting

CONCEPT · 20%

The institutional gap

- **Fragmented:** prospectus, KYC, tokenisation and settlement sit in disconnected systems.
- **Static:** one-time KYC cannot react to identity expiry, freezing or rule changes.
- **Opaque:** institutions struggle to prove approval, eligibility and payment-to-mint matching.

Our solution

One workflow for all four roles. AI accelerates review; humans retain authority. Compliance becomes an execution gate.

DEEP CVI INTEGRATION

A-Pass: who can invest

- Issue encrypted A-Passes after KYC; support query, overwrite confirmation and lifecycle status.
- Enforce **status, expiry, tier/sub-tier and jurisdiction**; frozen or expired identities fail closed.
- Recheck eligibility before payment and at confirmation to prevent stale approvals.

Continuous control: identity is checked at action time, not copied from historical KYC.

DEEP CVA INTEGRATION · HIGHEST WEIGHT 30%

A-Token: what they can hold

- Only internally **Approved** issuances may launch an A-Token.
- Asset rule packs bind CVI tiers to jurisdiction allow/deny lists.
- Require **ISSUED + valid address + verification code 4** before payment.

Closed loop: A-Pass × A-Token rules × dual checks govern issuance, payment and minting.

IS Issuer

Structures assets, drafts disclosures, launches A-Tokens, settles subscriptions and distributes coupons.

IM Licensed Intermediary

Performs compliance review and due diligence; manages KYC/AML and investor A-Passes.

RG Regulator

Reviews evidence, monitors status, and approves an issuance or requests changes.

IV Investor

Completes KYC, subscribes and pays with an eligible wallet, then tracks holdings and yield.

DEPLOYED CHAIN & FULL CONTRACT EVIDENCE
